ABSTRACT

A lever connector includes a first connector housing, a second connector housing that includes a distal fitting portion to which a distal end of the first connector housing is fittedly connected, and is attached to a connector attaching plate in a state of inserting the second connector housing through a connector attaching hole of the connector attaching plate, a lever pivotally that is equipped on the first connector housing and fits the first connector housing into the second connector housing by a pivoting operation of the lever, and a grommet that is mounted on the first connector housing and ensures a waterproofing property of an inside of the first connector housing. The lever includes a lever body and an operation plate. The grommet includes an operation plate a tubular portion.

LEVER CONNECTOR WITH WATERPROOFING

CROSS REFERENCE TO RELATED APPLICATION

This application is a continuation of PCT application No. PCT/JP2012/053286, which was filed on Feb. 13, 2012 based on Japanese Patent Applications No. 2011-030102 filed on Feb. 15, 2012, the contents of which are incorporated herein by reference.

BACKGROUND OF THE INVENTION

1. Technical Field

The present invention relates to a lever connector, in which a second connector housing to be fitted with a first connector housing is attached as a standby connector on a connector attaching plate, the first connector housing is equipped with a waterproofing grommet, and a fitting connection between the first connector housing and the second connector housing is obtained by a pivoting operation of a lever equipped on the first connector housing.

2. Background Art

FIG. 8 shows an example of a lever connector according to the related art.

A lever connector **100** shown in the figure is that disclosed in PTL1 as described below, and is used for connecting electric wires inside and outside a connector attaching plate (panel) **130**, such as a door panel for vehicles.

The lever connector **100** is configured such that a second connector housing **120** to be fitted with a first connector housing **110** is attached as a standby connector on the connector attaching plate **130** and the first connector housing **110** is equipped with a waterproofing grommet **140**. Also, in the lever connector **100**, a fitting connection between the first connector housing **110** and the second connector housing **120** is obtained by a pivoting operation of a lever **150** equipped on the first connector housing **110**.

The first connector housing **110** includes a housing body **112** and an outer case **113** for accommodating and holding the housing body **112** via the grommet **140**.

The housing body **112** has a plurality of terminal receiving holes **111** for receiving a first connection terminal. The housing body **112** is pressed into the grommet **140**, after the grommet **140** is mounted on the outer case **113**.

The second housing **120** includes a housing body **122**, a cylindrical-shaped hood portion **123** formed to be extended from a front end of the housing body **122**, and a panel engaging portion **124** formed on the hood portion **123**.

The housing body **122** has a plurality of terminal receiving holes **121** for receiving a second connection terminal, which is adapted to be fitted with the first connection terminal inside the first connector housing **110**.

The hood portion **123** is a component into which a portion, which is holding the housing body **112** of the first connector housing **110**, is fitted. On an inside surface of the hood portion **123**, a guide shaft **127** capable of engaging with the lever **150** is formed to protrude therefrom.

The panel engaging portion **124** has a shape of a groove, in which a peripheral edge of a connector attaching hole **131** formed in the connector attaching plate **130** is engaged, and fixes the second connector housing **120** to the connector attaching plate **130**.

To prevent rattling, the panel engaging portion **124** is equipped with an elastic ring **133** or a retaining spring **134**.

2

The grommet **140** includes a body accommodating portion **141** mounted on the inner peripheral surface of the outer case **113** in a tightly contact state and adapted for the housing body **112** to be pressed therein, and a tubular portion **142** extended from the outer case **113** to the outside. The tubular portion **142** receives a cable connected to the first connector housing **110**.

The lever **150** is pivotally supported on a lever supporting shaft **116** formed to protrude from an outside surface of the outer case **113**. A guide groove **157**, in which the guide shaft **127** of the second connector housing **120** is engaged, is notched in the lever **150**. Upon a pivoting operation, the lever **150** forces the first connector housing **110** to be pulled into the second connector housing **120** by pulling the guide shaft **127**, which has been engaged in the guide groove **157**, toward a terminating end of the guide groove **157**.

The first connector housing **110** is pulled into the second connector housing **120** by the pivoting operation of the lever **120**, and as a result, the first connector housing **110** is fitted and connected to the second connector housing **120**.

CITATION LIST

Patent Document

PTL1: JP-A-2005-166575

SUMMARY OF THE INVENTION

However, in the lever connector **100** disclosed in PTL1, a waterproofing grommet **140** is mounted inside the first connector housing **110**. Therefore, the first connector housing **110** or the second connector housing **120** must have a large volume allowing the grommet **140** to be accommodated therein, thereby causing a problem in which sizes of the connector housings are increased to allow the grommet **140** to be mounted therein.

Also, in the lever connector **100** disclosed in PTL1, the grommet **140** must be carefully mounted on the outer case **113** so that an outer peripheral surface of the body accommodating portion **141** is tightly contacted with the inside surface of the outer case **113**. As a result, there is a problem in which mounting of the grommet **140** takes time, and thus assembly efficiency thereof is poor.

Further, in the lever connector **100** disclosed in PTL1, a significant change in the exterior appearance before and after a fitting connection between the first connector housing **110** and the second connector housing **120** has been completed is not occurred. Therefore, there is also a problem in which whether or not the fitting connection between the first connector housing **110** and the second connector housing **120** has been successfully completed is not simply distinguished by the external appearance or the like.

Accordingly, an object of the present invention is to solve the above problems, and to provide a lever connector, in which increasing in size of connector housings to allow a grommet to be mounted therein is prevented, the grommet is be easily mounted, and also whether or not the fitting connection between the connector housings has been successfully completed is simply distinguished by observing the external appearance.

Solution to Problem

The object of the present invention is achieved by the following configurations.

(1) A lever connector includes a first connector housing, a second connector housing that includes a distal fitting portion

3

to which a distal end of the first connector housing is fittedly connected, and is attached to a connector attaching plate in a state of inserting the second connector housing through a connector attaching hole of the connector attaching plate, a lever pivotally that is equipped on the first connector housing and fits the first connector housing into the second connector housing by a pivoting operation of the lever, and a grommet that is mounted on the first connector housing and ensures a waterproofing property of an inside of the first connector housing. The lever includes a lever body pivotally coupled to the first connector housing and pulls the first connector housing into the second connector housing by pivoting the lever, and an operation plate that is extended from a rear end of the lever body and serves as an operation portion for pivoting the lever body. When fitting between the connector housings is completed by the pivoting operation, the operation plate is moved toward the connector attaching plate in a state where the operation plate is parallel to the connector attaching plate and protrudes beyond an outer peripheral of the first connector housing in a flange shape. The grommet includes an operation plate covering portion that is coupled to the operation plate by a lip of the operation plate, the lip having a groove to be fitted on an outer peripheral edge of the operation plate, and a tubular portion that is integrally formed with the operation plate covering portion and receives a cable connected to the first connector housing. When fitting between the connector housings has been completed by the pivoting operation of the lever, the lip is tightly contacted with a peripheral edge of the connector attaching hole by movement of the operation plate toward the connector attaching plate to ensure the waterproofing property of the inside of the first connector housing.

(2) In the lever connector of (1), the second connector housing includes a panel fixing piece that performs a temporary fixation to the connector attaching plate when the distal fitting portion is inserted through the connector attaching hole in a state where the second connector housing is not connected to the first connector housing. The first connector housing includes a temporary fixation maintaining device that restricts a bending displacement of the panel fixing piece while the first connector housing is being fitted into the second connector housing to maintain the second connector housing in a fixed state to the connector attaching plate by the panel fixing piece, and that releases the restriction to the bending displacement of the panel fixing piece to allow a displacement of the second connector housing relative to the connector attaching plate when the first connector housing is completely fitted into the second connector housing. The operation plate of the lever includes a main fixation device that is engaged with a housing fixing portion of the connector attaching plate to fix the first connector housing to the connector attaching plate in a state where the lip is tightly contacted with the peripheral edge of the connector attaching hole, when the operation plate is pressed against the connector attaching plate in a state where the first connector housing is completely fitted into the second connector housing.

(3) In the lever connector of (1) or (2), the first connector housing is provided with a lever supporting shaft for pivotally supporting the lever, on a symmetrical axis extending through the center of a width direction of the first connector housing. The lever includes a pair of half levers supported by the lever supporting shaft and pulls the first connector housing into the second connector housing when being pivoted in opposite directions to each other, the pair of half levers having the same structure. The lever includes a pair of half levers supported on the lever supporting shaft and adapted to force the first connector housing to be pulled into the second connector housing

4

when being pivoted in opposite directions to each other, the pair of half levers having the same structure.

According to the configuration of the above (1), the grommet ensuring the waterproofing property of preventing that infiltration of water or the like into the first connector housing has no portion, which is mounted inside the first connector housing, and is attached on the operation plate of the lever, which is exposed to the outside of the first connector housing. Therefore, it is not necessary to ensure a volume for accommodating the grommet inside the first connector housing. As a result, increasing in size of the connector housings to allow the grommet to be mounted therein is prevented.

Also, according to the configuration of the above (1), the grommet is attached on the operation plate of the lever, which is exposed to the outside of the first connector housing, and thus as compared to conventional cases in which a portion of the grommet is fitted into the first connector housing, the grommet is easily mounted, thereby enhancing assembly efficiency.

According to the configuration of the above (2), when the first connector housing is fitted into the second connector housing, which has been temporarily fixed on the connector attaching plate by the panel fixing piece, the temporary fixation maintaining device of the first connector housing restricts a bending displacement of the panel fixing piece while fitting is being performed, and therefore, the second connector housing is maintained in a fixed state to the connector attaching plate by means of the panel fixing piece. In addition, if the first connector housing has been completely fitted into the second connector housing, the restriction to the bending displacement of the panel fixing piece by the temporary fixation maintaining device is released. As a result, due to a pressing force exerted from the first connector housing to the second connector housing, the second connector housing is displaced in a direction, in which the second connector housing is pushed out of the connector attaching hole. At this time, such a displacement is stopped when the main fixing device provided on the operation plate of the lever has been engaged with the housing fixing portion of the connector attaching plate.

In other words, there is a significant change between attaching locations of the second connector housing to the connector attaching plate before and after the fitting connection of the first connector housing has been completed. Therefore, whether or not the fitting connection between the connector housings has been successfully completed is simply distinguished by observing the external appearance.

According to the configuration of the above (3), the lever adapted to force the first connector housing to be fitted and connected to the second connector housing is constituted of a pair of half levers having the same structure, thereby inhibiting increase of component types to be manufactured and achieving reduction of manufacturing cost.

BRIEF DESCRIPTION OF DRAWINGS

FIG. 1 is an exploded perspective view showing one embodiment of a lever connector according to the present invention.

FIG. 2 is a perspective view showing a state in which a second connector housing shown in FIG. 1 is temporarily fixed to a connector attaching plate.

FIG. 3 is a perspective view showing a state in which a grommet is attached to a first connector housing shown in FIG. 2.

5

FIG. 4 is a perspective view showing a state in which a fitting connection between the first connector housing and the second connector housing shown in FIG. 3 has been completed.

FIGS. 5A to 5E are explanatory views showing operations of the lever in a process of fitting and connecting the first connector housing and the second connector housing shown in FIG. 1 to each other, in which FIG. 5A shows an unconnected state, FIGS. 5B to 5C show a state while fitting is being performed, FIG. 5D shows a temporarily fixed state in which the second connector housing is fixed to the connector attaching plate after a fitting connection has been completely fitted and connected, and FIG. 5E shows a regular fixation state in which the first connector housing, which has been completely fitted and connected, is fixed to the connector attaching plate.

FIGS. 6A to 6C are explanatory views showing operations of temporary fixation maintaining devices in a process of fitting and connecting the first connector housing and the second connector housing shown in FIG. 1 to each other, in which FIG. 6A shows a temporarily fixing state of the temporary fixation maintaining devices while fitting is being performed, FIG. 6B shows a temporarily fixing state of the temporary fixation maintaining devices when a fitting connection has been completed, and FIG. 6C shows a state in which the temporary fixation maintaining devices are released after the fitting connection has been completed.

FIGS. 7A to 7C are explanatory views showing operations, in which the grommet is tightly contacted with the connector attaching plate, in a process of fitting and connecting the first connector housing and the second connector housing shown in FIG. 1 to each other, in which FIG. 7A shows an unconnected state, FIG. 7B shows a state before a rip is tightly contacted with a peripheral edge of a connector attaching hole after the fitting connection has been completed, and FIG. 7C shows a state in which a ridge of the rip is tightly contacted with the peripheral edge of the connector attaching hole after the fitting connection has been completed.

FIG. 8 is a longitudinal sectional view showing a first connector housing and a second connector housing constituting a lever connector according to the related art.

DESCRIPTION OF EMBODIMENTS

A preferred embodiment of a lever connector according to the present invention will be now described in detail with reference to the accompanying drawings.

A lever connector 1 according to the embodiment is used for connecting electric wires inside and outside a connector attaching plate 3 which is, for example, a panel for vehicles, and as shown in FIGS. 1 to 3, includes a first connector housing 10, a second connector housing 20, a lever 30, and a grommet 40.

The first connector housing 10 is a connector housing intended for an electric wire outside the connector attaching plate 3 to be connected thereto. The first connector housing 10 has temporary fixation maintaining devices 12 respectively provided on both of left and right sides of a distal end 11 thereof adapted to be fitted into the second connector housing 20 as described below. Also, the first connector housing 10 is provided with a lever supporting shaft 14 for pivotally supporting the lever 30, on a symmetrical axis L1 (see FIG. 5A), which extends through the center of a width direction of the first connector housing 10. The temporary fixation maintaining devices 12 and the lever 30 will be described below.

The second connector housing 20 is a standby connector adapted to wait on the connector attaching plate 3 to be fittedly connected to the first connector housing 10. The sec-

6

ond connector housing 20 has a distal fitting portion 21 intended for the first connector housing 10 to be fittedly connected thereto. In addition, the second connector housing 20, as shown in FIG. 2, is attached to the connector attaching plate 3 in a state of inserting the distal fitting portion 21 through a connector attaching hole 3a of the connector attaching plate 3.

In the present embodiment, the second connector housing 20 includes panel fixing pieces 22 adapted to perform a temporary fixation to the connector attaching plate 3, when the distal fitting portion 21 is inserted through the connector attaching hole 3a in a state in which the second connector housing 20 is not connected to the first connector housing 10, and a positioning flange 23.

The panel fixing pieces 22 are respectively provided on both of left and right sides of the distal fitting portion 21. The panel fixing pieces 21 each has a structure in which an engaging protrusion 22b is provided on a free end of an elastic piece 22a thereof extending along a direction of inserting the distal fitting portion 21 into the connector attaching hole 3a.

When the distal fitting portion 21 is inserted through the connector attaching hole 3a, the positioning flange 23, as shown in FIG. 6A, is abutted on a rear surface of the connector attaching plate 3, and thus performs positioning to the connector attaching plate 3.

As shown in FIGS. 6A and 6B, the panel fixing pieces 22 are adapted to sandwich a peripheral edge of the connector attaching hole 3a between the positioning flange 23 and the engaging protrusions 22b, thereby providing a temporary fixation of the second connector housing 20 to the connector attaching plate 3.

As shown in FIG. 1, the temporary fixation maintaining devices 12 provided on the first connector housing 10 are each constituted of a protrusion 12a provided on the distal end 11 of the first connector housing 10 and a relief groove 12b extending backward from the protrusion 12a. The protrusions 12a, as shown in FIG. 6A, are abutted on rear surfaces of the panel fixing pieces 22 while the first connector housing 10 is being fitted into the second connector housing 20, so that a bending displacement of the panel fixing pieces 22 in a direction in which an engagement to the peripheral edge of the connector attaching hole 3a sandwiched between the panel fixing pieces 22 and the positioning flange 23 is released is restricted. Also, the relief grooves 12b, as shown in FIGS. 6B and 6C, are located on the backside of the panel fixing pieces 22 when the first connector housing 10 has been completely fitted into the second connector housing 20, so that the bending displacement of the panel fixing pieces 22 in the direction in which the engagement to the peripheral edge of the connector attaching hole 3a sandwiched between the panel fixing pieces 22 and the positioning flange 23 is released is allowed.

Namely, the temporary fixation maintaining devices 12 according to the present embodiment restrict the bending displacement of the panel fixing pieces 22 while the first connector housing 10 is being fitted into the second connector housing 20, so that the second connector housing 20 is maintained in a fixed state to the connector attaching plate 3 by means of the positioning flange 23 and the panel fixing pieces 22. In addition, the temporary fixation maintaining devices 12 release the restriction to the bending displacement of the panel fixing pieces 22 when fitting between the first connector housing 10 and the second connector housing 20 has been completed, so that a displacement of the second connector housing 20 in a direction in which the distal fitting portion 21 is pushed out of the connector attaching hole 3a relative to the connector attaching plate 3 is allowed.

The lever **30** is pivotally equipped on the lever supporting shaft **14** of the first connector housing **10**, and thus forces the first connector housing **10** to be fitted into the second connector housing **20** by a pivoting operation of the lever **30**.

In the present embodiment, the lever **30** includes a pair of half levers **30a** and **30b**. The pair of half levers **30a** and **30b** are pivotally supported on the lever supporting shaft **14** and when being pivoted in opposite directions to each other, forces the first connector housing **10** to be pulled into the second connector housing **20**. In the embodiment, both of the pair of half levers **30a** and **30b** have the same structure of including a lever body **31** and an operation plate **32**.

As shown in FIG. 5A, the lever body **31** in each of the half levers **30a** and **30b** has, at a distal end thereof, a protrusion **31a** adapted to be engaged with a lever engaging step section **26** inside the second connector housing **20**. Each of lever bodies **31** is pivoted to force the first connector housing **10** to be pulled into the second connector housing **20**.

The operation plate **32** in each of the half levers **30a** and **30b** is a plate-shaped portion extended from a rear end of the lever body **31** and serves as an operation portion when attempting to pivot the lever body **31**.

In the lever **30** according to the present embodiment, when fitting between the connector housings has been completed by a pivoting operation of the pair of half levers **30a** and **30b**, as shown in FIGS. 5D and 5E, the operation plates **32** are moved toward the connector attaching plate **3**, in a state in which the operation plates **32** are parallel to the connector attaching plate **3** and protrude beyond the outer peripheral of the first connector housing **10** in a flange shape.

The operation plate **32** in each of half levers **30a** and **30b** has a main fixation device **35**.

As shown in FIG. 5E, the main fixation devices **35** are engaged with a housing fixing portion **3b** of the connector attaching plate **3** to fix the first connector housing **10** to the connector attaching plate **3**, when the operation plates **32** are pressed against the connector attaching plate **3** in a state in which fitting between the first connector housing **10** and the second connector housing **20** has been completed.

The grommet **40** is mounted on the first connector housing **10**, thereby ensuring a waterproofing property of preventing infiltration of water or the like into the first connector housing **10**.

The grommet **40** according to the present embodiment is made of an elastic material, such as a synthetic rubber, having a waterproofing property, and as shown in FIG. 3, includes an operation plate covering portion **41** adapted to be coupled to the operation plates **32**, and a tubular portion **42** integrally formed with the operation plate covering portion **41**. The tubular portion **42** receives a cable, not shown, connected to the first connector housing **10**.

As shown in FIG. 3, the operation plate covering portion **41** has a lip **41b** formed along the entire circumference of an outer peripheral edge of a generally elliptical-shaped covering portion body **41a** adapted to cover an outside surface of a pair of operation plates **31**.

As shown in FIG. 7A, the lip **41b** has a groove **411** adapted to be fitted on outer peripheral edges of the operation plates **32**, and a ridge **412** slantly extending toward the connector attaching plate **3**.

The grommet **40** is coupled to the operation plates **32** by fitting outer peripheral edges of the operation plates **32** into the groove **411** of the lip **41b** of the operation plate covering portion **41**.

In a state in which fitting between the connector housings has been completed by a pivoting operation of the lever **30**, the grommet **40** according to the present embodiment, as

shown in FIG. 7C, is adapted such that the ridge **412** of the lip **41b** is tightly contacted with the peripheral edge of the connector attaching hole **3a** in an elastically deformed state by movement of the operation plates **32** toward the connector attaching plate **3**, thereby ensuring the waterproofing property of preventing infiltration of water or the like into the first connector housing **10**.

According to the lever connector **1** of the present embodiment as described above, the grommet **40** ensuring the waterproofing property of the inside of the first connector housing **10** has no portion, which is mounted inside the first connector housing **10**, and is attached on the operation plates **32** of the lever **30**, which are exposed to the outside of the first connector housing **10**. Therefore, it is not necessary to ensure a volume for accommodating the grommet **40** inside the first connector housing **10**. As a result, increasing in size of the connector housings to allow the grommet **40** to be mounted therein is prevented.

Also, according to the lever connector **1** of the present embodiment as described above, the grommet **40** is attached on the operation plates **32** of the lever **30**, which are exposed to the outside of the first connector housing **10**, and thus as compared to conventional cases in which a portion of the grommet **140** is fitted into the first connector housing **110**, the grommet **40** is easily mounted, thereby enhancing assembly efficiency.

Further, according to the lever connector **1** of the present embodiment as described above, when the first connector housing **10** is fitted into the second connector housing **20**, which has been temporarily fixed on the connector attaching plate **3** by the panel fixing pieces **22**, the temporary fixation maintaining devices **12** of the first connector housing **10**, as shown in FIG. 6A, restrict a bending displacement of the panel fixing pieces **22** while fitting is being performed. Therefore, the second connector housing **20** is maintained in a fixed state to the connector attaching plate **3** by means of the panel fixing pieces **22**. In addition, if the first connector housing **10** has been completely fitted into the second connector housing **20**, the restriction to the bending displacement of the panel fixing pieces **22** by the temporary fixation maintaining devices **12** is released as shown in FIGS. 6B and 6C. As a result, due to a pressing force exerted from the first connector housing **10** to the second connector housing **20**, as shown in FIG. 6C, the second connector housing **20** is displaced in a direction, in which the second connector housing **20** is pushed out of the connector attaching hole **3a**. At this time, such a displacement is stopped when the main fixing devices **35** respectively provided on the operation plates **32** of the lever **30** has been engaged with the housing fixing portion **3b** of the connector attaching plate **3**.

In other words, there is a significant change between attaching locations of the second connector housing **20** to the connector attaching plate **3** before and after the fitting connection of the first connector housing **10** has been completed. Therefore, whether or not the fitting connection between the connector housings has been successfully completed is simply distinguished by observing the external appearance.

In addition, according to the lever connector **1** of the present embodiment as described above, the lever **30** adapted to force the first connector housing **10** to be fitted and connected to the second connector housing **20** is constituted of a pair of half levers **30a** and **30b** having the same structure, thereby inhibiting increase of component types to be manufactured and achieving reduction of manufacturing cost.

Meanwhile, the present invention is not limited to the foregoing embodiment, but appropriate changes, modifications or the like thereof is made. In addition, material, shape, direc-

tion, number, installation position and the like of each of the components of the foregoing embodiment are not limited but arbitrary as long as the present invention is achieved.

For example, an attaching position of the second connector housing is not limited to a panel of vehicles or the like, but may be a wall surface or the like of a case for various electronic and electrical equipment.

INDUSTRIAL APPLICABILITY

According to the lever connector of the present invention, the grommet is attached on the operation plates of the lever, which are exposed to the outside of the first connector housing. Therefore, it is not necessary to ensure a volume for accommodating the grommet inside the first connector housing. As a result, increasing in size of the connector housings to allow the grommet to be mounted therein is prevented.

Also, according to the lever connector of the present invention, the grommet is attached on the operation plates of the lever, which are exposed to the outside of the first connector housing, and thus as compared to conventional cases in which a portion of the grommet is fitted into the first connector housing, the grommet is easily mounted, thereby enhancing assembly efficiency.

REFERENCE NUMERALS LIST

- 1 Lever connector
- 3 Connector attaching plate
- 3a Connector attaching hole
- 3b Housing fixing portion
- 10 First connector housing
- 12 Temporary fixation maintaining devices
- 14 Lever supporting shaft
- 20 Second connector housing
- 21 Distal fitting portion
- 22 Panel fixing pieces
- 23 Positioning flange
- 30 Lever
- 30a, 30b Half lever
- 31 Lever bodies
- 32 Operation plates
- 35 Main fixing devices
- 40 Grommet
- 41 Operation plate covering portion
- 41a Covering portion body
- 41b Lip
- 42 Tubular portion
- 411 Groove

The invention claimed is:

1. A lever connector, comprising:

a first connector housing;

a second connector housing that includes a distal fitting portion to which a distal end of the first connector housing is fittedly connected, and is attached to a connector attaching plate in a state of inserting the second connector housing through a connector attaching hole of the connector attaching plate;

a lever pivotally that is equipped on the first connector housing and fits the first connector housing into the second connector housing by a pivoting operation of the lever; and

a grommet that is mounted on the first connector housing and ensures a waterproofing property of an inside of the first connector housing,

wherein the lever includes:

a lever body pivotally coupled to the first connector housing and pulls the first connector housing into the second connector housing by pivoting the lever; and an operation plate that is extended from a rear end of the lever body and serves as an operation portion for pivoting the lever body, and

wherein when fitting between the connector housings is completed by the pivoting operation, the operation plate is moved toward the connector attaching plate in a state where the operation plate is parallel to the connector attaching plate and protrudes beyond an outer peripheral of the first connector housing in a flange shape; and

wherein the grommet includes:

an operation plate covering portion that is coupled to the operation plate by a lip of the operation plate covering portion, the lip having a groove to be fitted on an outer peripheral edge of the operation plate; and

a tubular portion that is integrally formed with the operation plate covering portion and receives a cable connected to the first connector housing, and

wherein when fitting between the connector housings has been completed by the pivoting operation of the lever, the lip is tightly contacted with a peripheral edge of the connector attaching hole by movement of the operation plate toward the connector attaching plate to ensure the waterproofing property of the inside of the first connector housing.

2. The lever connector according to claim 1, wherein the second connector housing includes a panel fixing piece that performs a temporary fixation to the connector attaching plate when the distal fitting portion is inserted through the connector attaching hole in a state where the second connector housing is not connected to the first connector housing,

wherein the first connector housing includes a temporary fixation maintaining device that restricts a bending displacement of the panel fixing piece while the first connector housing is being fitted into the second connector housing to maintain the second connector housing in a fixed state to the connector attaching plate by the panel fixing piece, and that releases the restriction to the bending displacement of the panel fixing piece to allow a displacement of the second connector housing relative to the connector attaching plate when the first connector housing is completely fitted into the second connector housing, and

wherein the operation plate of the lever includes a main fixation device that is engaged with a housing fixing portion of the connector attaching plate to fix the first connector housing to the connector attaching plate in a state where the lip is tightly contacted with the peripheral edge of the connector attaching hole, when the operation plate is pressed against the connector attaching plate in a state where the first connector housing is completely fitted into the second connector housing.

3. The lever connector according to claim 1, wherein the first connector housing is provided with a lever supporting shaft for pivotally supporting the lever, on a symmetrical axis extending through the center of a width direction of the first connector housing, and

wherein the lever includes a pair of half levers supported by the lever supporting shaft and pulls the first connector housing into the second connector housing when being pivoted in opposite directions to each other, the pair of half levers having the same structure.

11

4. The lever connector according to claim 2, wherein the first connector housing is provided with a lever supporting shaft for pivotally supporting the lever, on a symmetrical axis extending through the center of a width direction of the first connector housing, and

5

wherein the lever includes a pair of half levers supported by the lever supporting shaft and pulls the first connector housing into the second connector housing when being pivoted in opposite directions to each other, the pair of half levers having the same structure.
